

VERIFIN

EXPECTED TEST RESULTS

REFERENCE ONLY -- AI RESULTS MAY VARY

These are expected behavioral outcomes, not hard-coded AI answers. A production AI model may describe the same risk differently. The important requirement is that the system identifies the relevant evidence and produces a reasonable, explainable result.

Scenario 1 -- Complete KYC + Normal Transactions

Expected: KYC should generally be considered complete. Normal transaction activity should generally produce low-risk indicators.

Scenario 2 -- Incomplete KYC

Expected: The system should identify missing address verification rather than incorrectly declaring KYC complete.

Scenario 3 -- Unusual Transactions

Expected: The system should identify transaction velocity, repeated transfers, and unusual geographic behavior as potential risk indicators requiring review.

Scenario 4 -- High-Risk Transactions

Expected: The system should identify the unusually large and repeated transfer activity and recommend heightened review or escalation.

Scenario 5 -- Multiple Transaction Documents

Expected: All three transaction PDFs should be available to the evidence/AML pipeline. The system must not silently use only the first uploaded file.

Scenario 6 -- Malformed Transaction Data

Expected: The system should reject or flag the malformed data and should not generate an unjustifiably confident risk conclusion from invalid input.

Important

These documents are synthetic software-testing artifacts. They are not genuine passports, bank statements, utility bills, financial records, or identification documents. Any risk language used by Verifin when analyzing them should be framed as risk indicators, potential anomalies, or review recommendations -- not as findings of actual criminal conduct.
